**Vulnerability and adaptive capacity of Inuit women to climate change: A case study from Iqaluit, Nunavut**

Anna Bunce and Dr. James Ford
Department of Geography, McGill University

**Introduction**

Climate change impacts in the Arctic will be differentiated by gender, yet few empirical studies have investigated how. Using a case study from Iqaluit, Nunavut, we identify and characterize vulnerability and adaptive capacity of Inuit women to changing climatic conditions.

**Methods**

Photovoice with 3 participants
42 Community Interviews
3 Stakeholder Focus Groups

**Participant Profile**

Most interviews had children in the home

Employment Status

Majority of interviews rent their home

Majority have lived in Iqaluit for 20+ years

**Observations of Change**

“It’s not just science, it’s not just somebody telling us the ice is melting, we’re actually living it here.” — Interviewee

Consistent with research across the North, women in Iqaluit were experiencing considerable environmental changes in and around the community. While interviewees did not always explicitly link these changes to longer term climate change, many of the observed changes are consistent with those identified as symptomatic of longer term directional change in the scientific literature. Ten changes were reported by more than one participant and are presented in the graph above.

**Impact of Changes**

Berry Picking
- Women reported “bad” berry harvesting years becoming more frequent
- Poor berry seasons have had a particular impact on women as this is a female led harvesting activity
- Berry picking provides mental health benefits

Sewing
- Sewing was reported to help women connect to Inuit identity, de-stress, and potentially provide income
- Interviewees reported reduced access to skins as a result of reduced hunting
- Knowledge of how to clean skins is a skillset many interviewees regretted not having

Time on the Land
- Women expressed wanting to spend more time on the land and emphasized the positive impact time on the land has on their mental health.
- Few women are able to spend time on the land regularly
- Barriers to spending time on the land included work hours, weather (such as increasing rain), money, access to equipment, injuries and chronic illness of themselves and/or their partner, and grieving loved ones.

Mental Health and Inuit Identity
- Similar findings have been documented in smaller Inuit communities across the north, although not through a gendered lens. 
- Berry picking, spending time on the land, and sewing all have a positive impact on women’s mental health and help reaffirm Inuit identity
- Interviewees emphasized impact climate change is having on the mental health of men in their lives. Women described men as being increasingly stressed which in turn caused them stress.
- Male stress and frustration were described as being linked to less time on the land, particularly during hunting shoulder seasons, which other research has found to be lengthening.
- Some women said they worry more now when loved ones are out on the land (particularly when they’re alone) due to poor ice conditions and unpredictable weather.

**Factors of Adaptive Capacity**

- Lack of heating (Energy Security)
- Substance Abuse
- Physical Abuse
- Spousal Violence
- Health: Ongoing (treatment, pain)
- Income: Ongoing (wage, benefits)
- Social status: Ongoing (status, control)
- Access to inquiry
- Access to status
- Employment: Ongoing (unemployed, employed)
- Access to land
- Access to traditional knowledge

**Conclusion**

- Very little research looks at the gendered nature of climate change and that which exists largely focuses on the experiences of women in the global South.
- The global narrative is that women are more vulnerable to climate change than men, however this narrative is based on the experiences of women in developing countries who take on agricultural responsibilities while men migrate to cities for wage work. In Iqaluit we find the reverse to be true; Inuit women tended to earn a regular income, while men were more often engaged with land based activities along with part time or seasonal work.
- Despite the rapid changes in the North, climate change is not the most pressing issue Inuit women face on a daily basis, however climate change exacerbates socio-cultural issues facing Canada’s North.
- Supporting the components which impact women’s adaptive capacity to climate change has the potential to help support their capacity to adapt to other socio-cultural changes Inuit women are experiencing.
